

Virus destroys KSA's systems

By Mark Moldowan

Kwantlen Chronicle

An unknown virus wreaked havoc on the KSA's computer systems, rendering all online services of the KSA inoperable.

According to Rob Myles, a computer support technician for the KSA, the virus had infiltrated the KSA's e-mail system.

"[The Virus] then embedded itself in a file that was transferred to our website" says Myles.

The virus was hidden as an agenda file, a file-type which is uploaded regularly by the KSA executives.

The damage the virus caused was so severe that the system had to be restored to its current state using the backup files.

The e-mail system is currently the only part of the KSA's network that is functioning.

"Our e-mail services took priority," says Myles, "so our website should be up shortly."

The KSA is taking advantage of the situation, and says that the new website will be "new and greatly improved" according to Myles.

New features to the KSA site will include online polls, interactive calendars, and a new format for the KSA forums.

"Keep your eyes out for the new site" says Myles.

There is no set date for the website's completion.
